Overview

RnR is a two-player game where opponents must engage competitively to gain possession of the golden bead in the centre of the board by outsmarting their opponent and claiming the win by bringing it to their respective home base (red hexagon block).

Objective

The aim of the game is to manoeuvre a twin set of beads [A pair of beads of the same colour within the hexagon grid] to the opponent's capture block on either side of the golden block (blue and black respectively) to gain possession of the golden bead which they need to strategically move to their respective home base (red blocks on the blue or black sides of the board), while making sure that the player doesn't lose their possession of the golden bead to their opponent.

Through a series of mechanisms, players must try to:

1. Gain possession of the golden bead.
2. Defend their possession.
3. Create a pathway for the golden bead to their respective home base.

Components and Setup

One hexagon board

45 beads total:

- 1 golden bead
- 22 black beads
- 22 blue beads

Players must arrange the beads as shown below:

Movement mechanics

Sliding mechanic: There can only be always a maximum of two beads in a block.

Beads must be slid into a block that has up to one bead in it (it may also be empty). A bead cannot slide into a block if there are already two beads in that block. If there are two beads in a block next to a single bead block, the same-coloured bead from the two beads can be slid to the single bead. The single bead cannot be moved.

Swapping mechanic: this is a simple mechanic where players may simply swap two beads with each other. The pair swapped must include one of the players own beads (of their respective colour). A bead from a pair may be swapped with a single bead, but a single bead may not be swapped with a bead from a pair. Refer to the diagram above.

Jumping mechanic: This mechanic is used as an immediate passage across the board to outplay opponents. Players can only use this mechanic when two beads are in the blocks that are adjacent to the green half hexagons. They have a choice as to which of the three adjacent blocks they can jump to and must perform a swap motion as indicated in the diagram to the right.

Capturing the golden bead: Once a player has managed to manoeuvre a twin set of beads to their respective capture blocks (isolated colour blue/black coloured blocks on either side of the golden block) they are eligible to capture the golden bead. They must swap out the golden beads with one of their own to gain possession. At the bottom corner of each side of the board there are four circles (capture circles). When a player has obtained the golden bead, they will lose their bead and it will be placed in the opponent's capture circles as shown in the diagrams above.

When wanting to steal the bead, a player must have a twin set of beads next to the gold bead and it's "possessive" to steal it. The player with the gold bead will lose their bead and it will be placed in the captors capture circles as shown above.

Penalties

- If a player repeats a move to undo their opponents previous move and this is recognised by the opponent, they can remove that bead from the board permanently.
- If a player moves the golden bead incorrectly the opponent will remove a bead from their circle counter.

How to play

To begin the game players will take alternative turns to remove any three beads of their choosing from the board. This move will not be repeated and the beads that have been removed will not be playable again.

Players need to make their way to the golden bead by manoeuvring twin beads into their respective capture blocks (blue and black blocks). The players and opponent's beads can be placed in the same block.

At the bottom corner on each side of the board there are 4 circles (capture circles). Once the golden bead is obtained, the player that initially captures the golden bead will lose their bead and will place that bead into one of the opponents capture circles. This bead will not be playable again. Players are not allowed to use the jump mechanic for the golden bead.

After the golden bead is captured, the golden bead block can no longer be used by players. Players must carry on playing the game and avoid placing beads in that block.

When the golden bead is stolen from a player, the player loses one of their beads and will place it into one of the opponent's circles. This will continue until all four of the circles have been filled.

Once all four capture circles of a player have been filled, they now gain several advantages:

- The golden bead can now be moved as if it were their own (all the mechanisms now apply to the golden bead as if it were a normal bead and twin beads are not needed to move it) however players must still heed to previous rules until their capture circles are filled.
- The player can now use the jump mechanic for the golden bead, provided that they have twin beads on the other side (within the block the player intends to move the golden bead to).

Once the capture circles are filled players will stop losing their beads after gaining and losing possession of the golden bead. The game will end when the golden bead has entered any of the players respective home bases.
